TRABALHO DE MICROELETRÔNICA 1
PROJETO APLICATIVO

Trabalho de laboratório orientado pela professora Doutora Sibilla França, da disciplina de Microeletrônica I, do curso de Engenharia Elétrica da Universidade Federal do Paraná.

CURITIBA
2016

SUMÁRIO

INTRODUÇÃO

Este projeto aplicativo fundamenta-se no conhecimento adquirido em sala de aula, na matéria de Microeletrônica 1, do curso de Engenharia Elétrica da Universidade Federal do Paraná, matéria ministrada pela Professora Doutora Sibilla França.

A proposta deste relatório é documentar e formalizar o projeto desenvolvido para a conclusão da matéria. O qual tem por objetivo aplicar todos os conceitos vistos e apresentados em sala de aula sobre VHDL. Serão realizadas simulações prévias para verificar o funcionamento do código, também será implementado o circuito e feito *upload* para o kit de desenvolvimento.

Para executar esta tarefa será utilizado um computador, cabo USB e uma placa FPGA Nexys 2 Spartan 3 e os softwares Xilinx ISE e Digilent Adept 2.

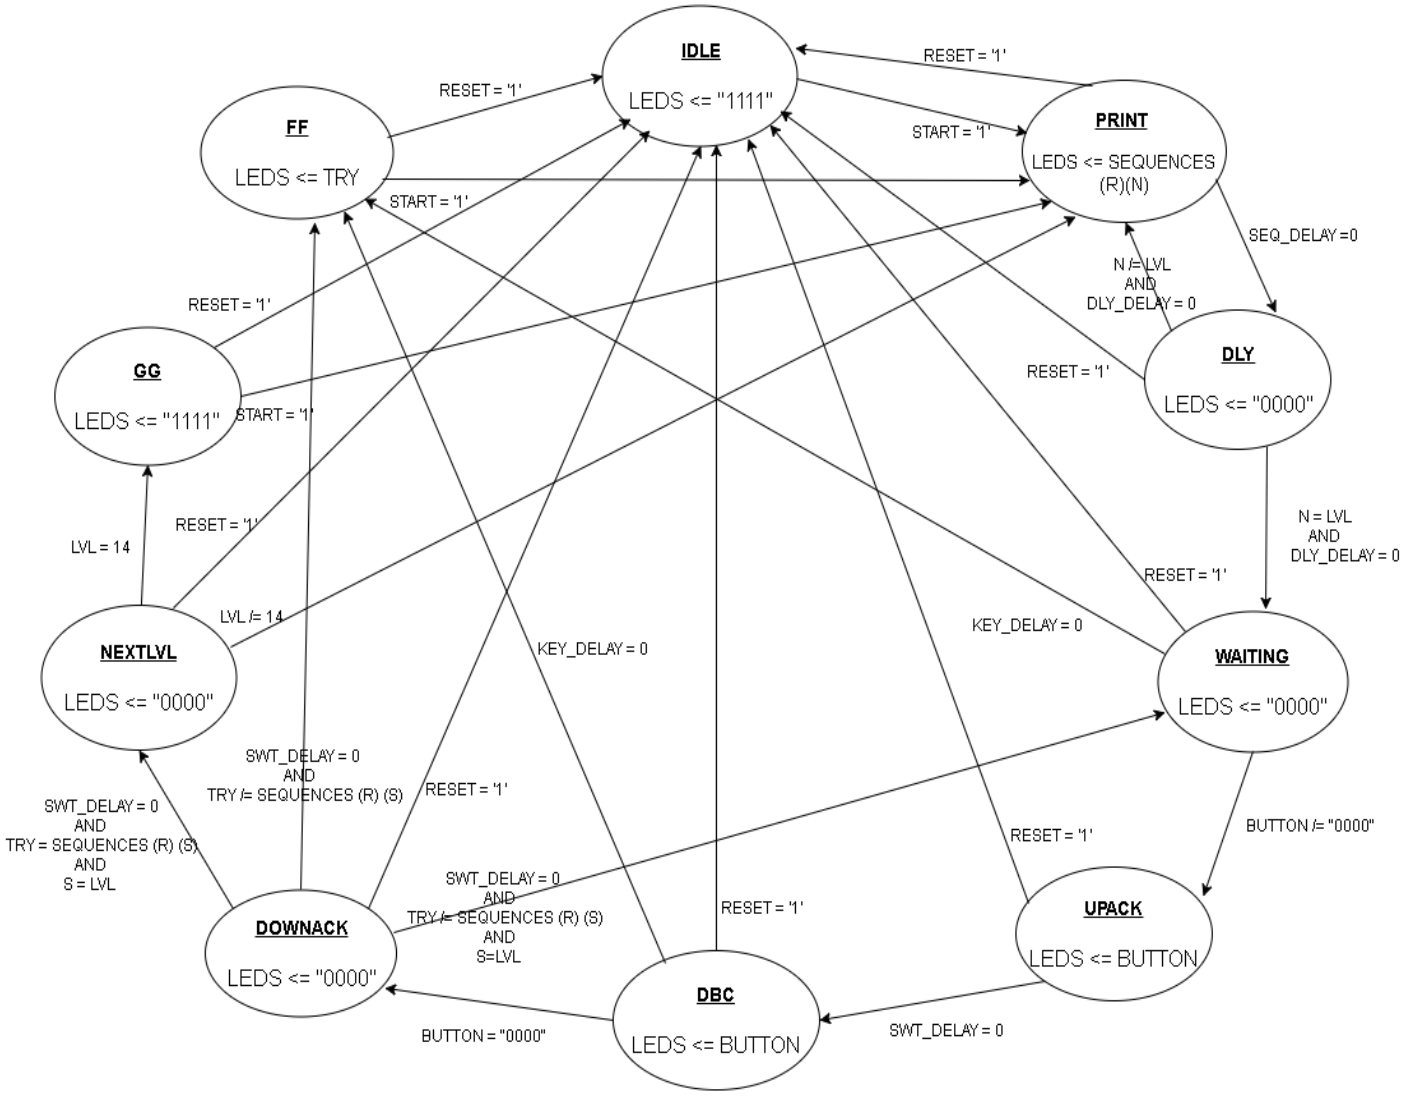
OBJETIVO

O objetivo deste projeto é utilizar o software Xilinx ISE para criar o código em VHDL que cumpra o desafio proposto.

Neste projeto a tarefa é implementar o jogo Genius em FPGA. O projeto deverá cumprir os seguintes requisitos: Ao ligar o dispositivo, uma mensagem de inicialização deverá ser apresentada nos displays de 7 segmentos: “PROJETO APLICATIVO - ED”. Um rolamento das letras através dos 4 displays deverá garantir a visualização da mensagem inicial; O início do jogo se dará através do acionamento de um botão do kit; Para representar as quatro cores deverá ser utilizado os quatro leds do kit NEXYS2; Disponibilizar a primeira sequência e verificar se o jogador pressionou o botão correto (por exemplo, LED0 – SW0) dentro do tempo máximo de 5 segundos; Repetir o primeiro sinal e acrescentar mais um (utilizar 14 sequências). Verificar a sequência inserida pelo jogador; A cada acerto, o jogador soma 01 ponto. Esta pontuação deverá ser mostrada nos displays de 7 segmentos e em um monitor com resolução de 800x600 (usar saída VGA do kit); No monitor, também deverá ser exibida a sequência luminosa, utilizando as cores verde, amarelo, azul e vermelho; O acionamento de um mecanismo mecânico do kit deverá permitir a reinicialização do dispositivo de forma a iniciar-se novo; O botão INICIAR não reinicia o jogo; Utilizar dois switches para selecionar o nível de dificuldade do jogo (00 – fácil, 01 – médio, 10 – difícil); Se o jogador acertar todas as sequências, uma mensagem deve aparecer nos displays de 7 segmentos indicando que o jogador ganhou como, por exemplo, “PARABENS”; A mensagem também deve aparecer no monitor (ou as iniciais da mensagem); Se o jogador errar alguma das sequências, uma mensagem deve aparecer nos displays de 7 segmentos indicando que o jogador perdeu como, por exemplo, “GAME OVER”. Um rolamento das letras através dos 4 displays deverá garantir a visualização da mensagem final.

1. ELABORAÇÃO DA MÁQUINA DE ESTADOS

A fim de definir os estados, condições de transição e valores de saída para cada momento do jogo, o diagrama a seguir foi desenvolvido exemplificando o funcionamento do projeto, buscando cumprir o objetivo proposto.



Buscando melhor organizar o código e a máquina de estados em si, foram criados um total de 10 estados responsáveis por controlar o andamento do jogo e decidir, mediante a alterações na entrada, qual será o próximo estado do sistema. Para não sobrecarregar um estado com muitas funções, tal divisão foi realizada de forma que cada estado possuisse um objetivo específico bem definido e assim pudesse ser melhor compreendido e testado durante as etapas de desenvolvimento e simulação.

2. DESENVOLVIMENTO

2.1. JOGO GENIUS

Para o desenvolvimento do projeto aplicativo do jogo Genius, foram implementados 2 *packages*, 3 *modules*, 1 *testbench* e 1 *implementation constraints file*. Os trechos mais relevantes de alguns desses códigos serão comentados neste capítulo. Todos estes códigos VHDL encontram-se na íntegra na sessão de anexos deste relatório.

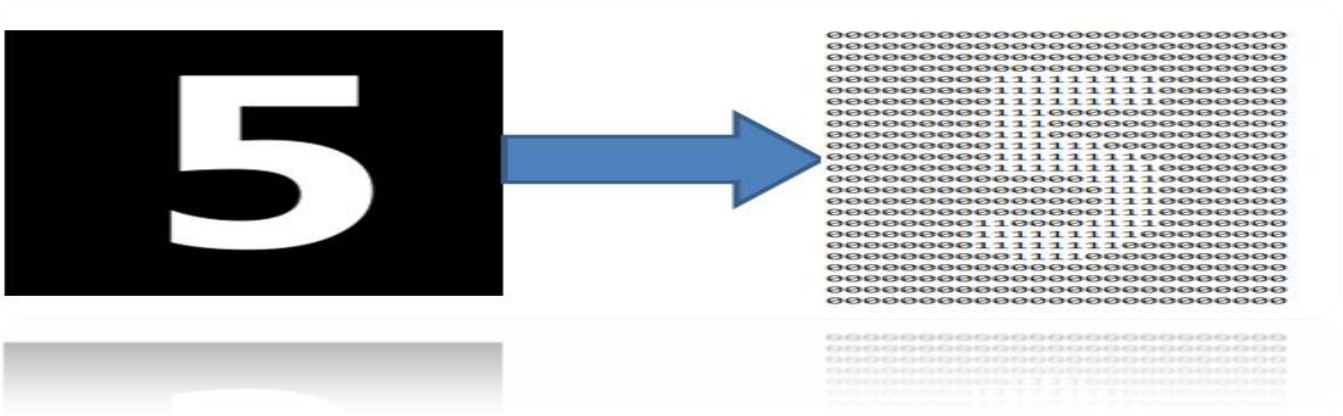
2.1.1. Rom_characters.vhd

```
1  -- Package que define as constantes com o desenho de cada um dos caracteres utilizados
2  -- Números: 0, 1, 2, 3, 4, 5, 6, 7, 8, 9
3  -- Letras: F, G
4  -- Constantes de 200x200 pixels
5
6  library IEEE;
7  use IEEE.STD_LOGIC_1164.all;
8
9  package rom_characters is
10
11    constant h: integer := 200;
12    constant v: integer := 200;
13    type char_data is array (0 to v-1) of std_logic_vector (0 to h-1);
14
15    constant zero: char_data := (
16 "00000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000
17 "00000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000
18 "00000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000
19 "00000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000
20 "00000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000000
```

Este *package* define um *type* chamado “char_data” que cria um arranjo de vetores, visando criar uma memória com o desenho de cada um dos caracteres utilizados na exibição do placar e de siglas no VGA (0, 1, 2, 3, 4, 5, 6, 7, 8, 9, G, F). Cada caractere possui 200x200 *pixels* e foi primeiramente desenhado, para então ser convertido em um desenho em texto formado por bits ‘0’ e ‘1’, que representam as áreas em preto e em branco, respectivamente, a serem mostradas na tela de jogo.

O esquema a seguir exemplifica este processo, que foi realizado com auxílio do software Gimp[4] e o site Dcode[5].

Conversão de imagem para matriz binária



2.1.2. Global_pack.vhd

Parte 1

```
1  -- Package global que implementa os tipos necessários no projeto, bem como procedures e constantes
2
3  library IEEE;
4  use IEEE.STD_LOGIC_1164.all;
5  use work.rom_characters.all;
6
7  package global_pack is
8
9     type states is (idle, print, dly, waiting, upack, dbc, downack, nextlvl, gg, ff); -- Estados da máquina
10    type pa_ed is array (22 downto 0) of std_logic_vector (6 downto 0); -- Arranjo da mensagem inicial
11    type score is array (3 downto 0) of std_logic_vector (6 downto 0); -- Arranjo da pontuação
12    type enable is array (3 downto 0) of std_logic_vector (3 downto 0); -- Arranjo dos estados dos anodos
13    type sequence is array (14 downto 0) of std_logic_vector (3 downto 0); -- Arranjo de uma sequência
14
15    -- Constantes que definem as sequências possiveis de 14 cores para o jogo
16    constant seq0: sequence := ("0001","1000","0001","0010","0100","1000","1000",
17    "0100","0010","0001","0001","0010","0100","1000", "0000");
18
19    constant seq1: sequence := ("0001","1000","0001","0010","0100","0010","0100",
20    "1000","0001","1000","0001","0100","0010","1000", "0000");
21
22    constant seq2: sequence := ("0010","1000","0001","0010","0100","0010","1000",
23    "0100","1000","0001","0001","0010","0100","0001", "0000");
24
25    constant seq3: sequence := ("0100","0010","0001","0010","1000","1000","0100",
26    "0001","0010","1000","0001","0010","0100","0100", "0000");
27
28    constant seq4: sequence := ("0001","0001","1000","0010","0100","1000","1000",
29    "1000","0010","0100","0001","0010","0100","0010", "0000");
30
31    constant seq5: sequence := ("0100","1000","0010","0010","0100","1000","1000",
32    "0100","0010","0001","1000","0010","0001","0001", "0000");
33
34    constant seq6: sequence := ("1000","0010","0010","0010","0100","1000","0001",
35    "0100","1000","0100","0001","0010","0100","0100", "0000");
36
37    constant seq7: sequence := ("0001","1000","0010","0010","0100","1000","1000",
38    "0100","0001","0010","0001","0001","1000","1000", "0000");
39
40    constant seq8: sequence := ("0010","0001","0100","0001","0010","1000","0100",
41    "0100","1000","0001","1000","0010","0100","0010", "0000");
42
43    constant seq9: sequence := ("0100","1000","0001","0010","0010","1000","0001",
44    "0100","1000","0001","0010","0001","0100","0001", "0000");
45
46    type mult_seq is array (9 downto 0) of sequence; -- Arranjo das 10 sequências pré-definidas
47
48    constant sequences: mult_seq := (seq9, seq8, seq7, seq6, seq5, seq4, seq3, seq2, seq1, seq0);
49
50    -- Declaração da procedure que imprime os caracteres na região superior do monitor
51    procedure characters (h_count, v_count: in integer;
52                          first_char, secon_char: in char_data;
53                          red: out std_logic_vector (2 downto 0);
54                          green: out std_logic_vector (2 downto 0);
55                          blue: out std_logic_vector (1 downto 0));
56
57 end global_pack;
```

O *global_pack* trata-se de um *package* criado com o intuito de definir alguns novos *types* necessários ao projeto, bem como reunir e organizar constants e disponibilizar uma procedure que é utilizada muitas vezes dentro do component responsável pela parte de VGA do projeto.

(continuação)

O *type* “states” define os estados da máquina que controlaram o andamento do jogo.

O *type* “pa_ed” define um arranjo que corresponde ao código para mostrar a mensagem inicial “Projeto Aplicativo – ED” nos displays de sete segmentos.

O *type* “score” é um arranjo para exibição da pontuação do jogador nos displays de sete segmentos.

O *type* “enable” é um arranjo para multiplexação dos anodos dos displays, já que os catodos dos mesmos são curto-circuitados.

O *type* “sequence” é um arranjo que cria um vetor em que cada posição é um nibble, correspondente a uma das cores e ao estado dos LEDs na saída. Este type implementa as sequências do jogo.

Por último, o *type* “sequences” é um arranjo do *type* “sequence” criado anteriormente, o que cria uma matriz com dez possibilidades de sequências, que foram criadas e definidas como constants. Sendo assim, ganha-se uma maior dinâmica no jogo já que o jogador não ficará preso a uma única sequência de cores que seria facilmente memorizada.

Parte 2

```
59  package body global_pack is
60
61     -- Procedure que recebe os valores de caracteres e estabelece a lógica para impressão na tela
62     procedure characters (h_count, v_count: in integer;
63                           first_char, secon_char: in char_data;
64                           red: out std_logic_vector (2 downto 0);
65                           green: out std_logic_vector (2 downto 0);
66                           blue: out std_logic_vector (1 downto 0)) is
67
68     begin
69
70        if (h_count>250 and h_count<400 and v_count>50 and v_count<250) then
71           if (first_char(v_count-50)(h_count-225)='1') then
72              red := (others => '1');
73              green := (others => '1');
74              blue := (others => '1');
75           else
76              red := (others => '0');
77              green := (others => '0');
78              blue := (others => '0');
79           end if;
80        elsif (h_count>400 and h_count<550 and v_count>50 and v_count<250) then
81           if (secon_char(v_count-50)(h_count-375)='1') then
82              red := (others => '1');
83              green := (others => '1');
84              blue := (others => '1');
85           else
86              red := (others => '0');
87              green := (others => '0');
88              blue := (others => '0');
89           end if;
90        end if;
91
92     end characters;
93
94  end package body;
```

A *procedure* descrita no *package body* acima realiza a função de posicionar números e letras no monitor, para exibição do placar e das siglas de vitória e derrota. Para tal, ela requer quais serão os dois caracteres e qual é contagem horizontal e vertical do VGA.

2.1.3. Genius.vhd

Parte 1

```
 6  library ieee;
 7  use ieee.std_logic_1164.all;
 8  use work.global_pack.all;
 9
10  entity Genius is
11
12     generic ( d: integer := 5000000; -- Tempo de 100 ms
13               p: integer := 500000; -- Tempo de 10 ms
14               e: integer := 50000000; -- Tempo de 1 s
15               m: integer := 25000000; -- Tempo de 500 ms
16               h: integer := 10000000; -- Tempo de 200 ms
17               T: integer := 250000000); -- Tempo de 5 s
18     port ( clk, start, reset: in std_logic; -- Clock, Start e Reset
19            diff: in std_logic_vector (1 downto 0); -- Chaves seletoras de dificuldade
20            button: in std_logic_vector (3 downto 0); -- Push-buttons do jogo
21            display: out std_logic_vector (6 downto 0); -- Segmentos dos displays
22            anode: out std_logic_vector (3 downto 0); -- Anodos dos displays
23            leds: out std_logic_vector (3 downto 0); -- Leds de visualização
24            h_sync: out std_logic; -- Sinal de sincronização horizontal
25            v_sync: out std_logic; -- Sinal de sincronização vertical
26            red: out std_logic_vector (2 downto 0); -- Bits vermelho do VGA
27            green: out std_logic_vector (2 downto 0); -- Bits verde do VGA
28            blue: out std_logic_vector (1 downto 0) ); -- Bits azul do VGA
29
30  end Genius;
```

Neste trecho inicial do código principal, são declarados alguns valores do tipo GENERIC, para definição de constantes de tempo a serem utilizadas no projeto. São eles:

d – Tempo utilizado para promover um delay entre a exibição de uma cor e outra (100ms);
p – Tempo de debouncing no reconhecimento das transições dos push-buttons (10ms);
e – Tempo de exibição de cada cor para a dificuldade fácil (1s);
m – Tempo de exibição de cada cor para a dificuldade média (0,5s);
h – Tempo de exibição de cada cor para a dificuldade difícil (0,2s);
T – Tempo limite de espera por uma entrada do jogador (5s).

Além disso, as entradas e saídas do jogo são declaradas, de acordo com as especificações do kit de desenvolvimento e do projeto:

ENTRADAS: Clock, chave de start, chave de reset, chaves seletoras da dificuldade do jogo e botões para repetição da sequência por parte do jogador (1 botão para cada cor).

SAÍDAS: Catodos dos segmentos dos displays, anodos dos displays, LEDs (1 para cada cor), sincronização horizontal do VGA, sincronização vertical do VGA e os bits para cada uma das cores do RGB (3 para vermelho e verde, 2 para o azul, cujo o olho humano é menos sensível).

Parte 2

```
69  begin
70
71      -- Processo que implementa a lógica de estados do jogo
72      process(clk, pr_state, reset, start, seq_delay, diff)
73      begin
74
75      if (reset = '1') then
76
77          pr_state<=idle; -- Estado inicial em espera do jogo
78
79      elsif (rising_edge(clk)) then
80
81          -- Verificação da posição das chaves de dificuldade e atribuição ao sinal
82          if ( diff="00" ) then
83              seq_delay<=e;
84          elsif ( diff="01" ) then
85              seq_delay<=m;
86          elsif ( diff="10" ) then
87              seq_delay<=h;
88          else
89              seq_delay<=e;
90          end if;
91
92          -- Case dos estados da máquina
93          case pr_state is
```

Devido a dificuldades encontradas na implementação prática de um código de máquinas de estado com dois process no kit de desenvolvimento, decidiu-se por implementar a máquina de estados utilizando somente um process.

No trecho em destaque, encontra-se a lógica que verifica se o reset do jogo foi acionado e, em caso, positivo, passa o estado da máquina para idle. Caso o reset não esteja pressionado e ocorra um pulso de subida do clock, verifica-se o estado das chaves seletoras de dificuldade e dependendo do seu estado o valor de tempo adequado é repassado para o signal responsável pela contagem. Isto permite que a dificuldade do jogo seja alterada a qualquer momento, caso o jogador julgue necessário.

Estado **idle**

```
95          -- Estado inicial de espera da máquina
96          when idle => leds<="1111";
97                       nibble<="1111";
98                       lvl<=1;
99                       n<=0;
100                      s<=1;
101                      r<=0;
102
103                      if ( start='1' ) then
104                        pr_state<=print;
105                      end if;
```

O estado *idle* é o estado inicial do jogo, no qual se aguarda que o usuário mude o modo da chave start para ‘1’. Enquanto em *idle*, os ponteiros relacionados a posição das sequências e chaves esperadas são mantidos em seus valores iniciais, e os LEDs permanecem todos acesos.

Estado **print**

```
116         -- Estado que imprime as posições das sequências pré-definidas
117         when print => leds<=sequences(r)(n);
118                       nibble<=sequences(r)(n);
119                       dly_delay<=d;
120                       try<="0000";
121
122                       if ( seq_delay>0 ) then
123                           seq_delay<=seq_delay-1;
124                       else
125                           pr_state<=dly;
126                       end if;
```

O estado *print* é responsável pela exibição da sequência do jogo nos LEDs do kit, através dos ponteiros “r” e “n”, que definem qual sequência e qual posição dela deverá ser mostrada, respectivamente. Através do *signal* “nibble”, este valor é repassado para o componente do VGA, que pode então decidir qual cor deverá ser exibida na tela, durante o tempo definido pela posição das chaves de dificuldade.

Estado **dly**

```
119         -- Estado de delay entre a impressão de cada cor
120         when dly => leds<="0000";
121                     nibble<="0000";
122
123                     if ( dly_delay>0 ) then
124                        dly_delay<=dly_delay-1;
125                     else
126                        if ( n=lvl ) then
127                           pr_state<=waiting;
128                        else
129                           pr_state<=print;
130                           n<=n+1;
131                        end if;
132                     end if;
```

O estado *dly* serve para inserir um pequeno *delay* entre a exibição de cada cor, permitindo que o jogador perceba caso ocorra de uma mesma cor se repetir. Além disso, este estado verifica se já foram impressas todas as cores devidas de acordo com o nível atual ou se o jogo deve voltar a imprimir mais cores.

Estado **waiting**

```
153         -- Estado que aguarda que o jogador pressione um botão
154         when waiting => leds<="0000";
155                         nibble<="0000";
156                         swt_delay<=p;
157
158                         if ( key_delay>0 ) then
159                           key_delay<=key_delay-1;
160                         else
161                           pr_state<=ff;
162                         end if;
163
164                         if ( button/="0000" ) then
165                           try<=button;
166                           pr_state<=upack;
167                         end if;
```

Após mostrar todas as cores necessárias, o jogo entra no estado *waiting* e aguarda que o jogador pressione algum botão, buscando repetir a sequência mostrada. Caso nenhum *push-button* seja pressionado dentro de 5s, o jogo vai para o estado de derrota, denominado *ff*. Se algum botão for pressionado, o estado dos *push-buttons* é armazenado no *signal try* e a máquina avança para o próximo estado.

Estado **upack**

```
169         -- Estado de debouncing para o reconhecimento da subida do botão
170         when upack => leds<=button;
171                       nibble<=button;
172
173                       if ( swt_delay>0 ) then
174                           swt_delay<=swt_delay-1;
175                       else
176                           pr_state<=dbc;
177                       end if;
```

No estado *upack*, o jogo aguarda que uma contagem de *debouncing* seja concluída, evitando que possíveis “repiques” sejam identificados como várias pressionadas do botão. Terminado esta contagem de 10ms, o jogo avança para o estado seguinte.

Estado **dbc**

```
179         -- Estado que aguarda que o jogador solte o botão pressionado
180         when dbc => leds<=button;
181                     nibble<=button;
182                     swt_delay<=p;
183
184                     if ( key_delay>0 ) then
185                        key_delay<=key_delay-1;
186                     else
187                        pr_state<=ff;
188                     end if;
189
190                     if ( button="0000" ) then
191                        pr_state<=downack;
192                     end if;
```

Em *dbc*, espera-se que o jogador solte o botão pressionado anteriormente, para que então o jogo avance. Caso o *push-button* pressionado não seja solto dentro do tempo de 5s (contado a partir do momento em que o jogo entra em *waiting*), o jogo irá para o estado de derrota. Se o botão seja liberado dentro do tempo, a máquina de estados avança.

Estado **downack**

```
194       -- Estado de debouncing para o reconhecimento da descida do botão
195       -- Este estado também verifica se o botão correto foi pressionado
196       when downack => leds<="0000";
197                       nibble<="0000";
198
199                       if ( swt_delay>0 ) then
200                         swt_delay<=swt_delay-1;
201                       else
202                         key_delay<=T;
203                         if ( try=sequences(r)(s) ) then
204                            if ( s=lvl ) then
205                               pr_state<=nextlvl;
206                            else
207                               s<=s+1;
208                               pr_state<=waiting;
209                            end if;
210                         else
211                            pr_state<=ff;
212                         end if;
213                       end if;
```

O estado *downack*, semelhante ao estado *upack*, realiza uma contagem de debouncing de 10ms após detectado que o botão voltou ao normal. Feito isso, é verificado se a tentativa do jogador, armazenada em *try*, está de acordo com o que fora impresso. Um ponteiro diferente, denominado “s”, é utilizado para controlar quantos botões espera-se que o jogador pressione a fim de repetir a sequência apresentada. Se a sequência estiver correta e for a última cor esperada, o jogo segue para *nextlvl*. Caso o botão pressionado pelo jogador esteja correto mas ainda não for o último esperado, o jogo volta para o estado *waiting*. Por fim, se o botão pressionado não for aquele da cor correspondente, o jogo vai para o estado de derrota.

Estado **nextlvl**

```
215       -- Estado que incrementa o nível atual do jogo
216       when nextlvl => leds<="0000";
217                       nibble<="0000";
218
219                       if ( lvl=14 ) then
220                         pr_state<=gg;
221                       else
222                         pr_state<=print;
223                         lvl<=lvl+1;
224                         n<=0;
225                         s<=1;
226                       end if;
```

O estado *nextlvl* verifica se o nível atual é o último e, em caso afirmativo, atualiza o estado da máquina para o estado *gg* de vitória. Caso o jogador tenha repetido a sequência com sucesso mas ainda existam níveis a serem jogados, o jogo volta para o estado *print* e o nível do jogo é incrementado, assim como os ponteiros voltam ao valor inicial.

Estado **gg**

```
219         -- Estado final de vitória
220         when gg => leds<="1111";
221                    nibble<="1111";
222
223                    if ( start='1' ) then
224                       pr_state<=print;
225                       key_delay<=T;
226                       lvl<=1;
227                       n<=0;
228                       s<=1;
229                       r<=r+1;
230                       if (r=9) then
231                          r<=0;
232                       end if;
233                    end if;
```

Quando em *gg*, o jogo encontra-se no estado de vitória e aguarda que o jogador mude o estado da chave *start* para ‘1’ de modo a recomeçar o jogo. Se isso acontecer, o nível do jogo volta para 1 e a sequência a ser jogada a seguir muda, pois o ponteiro “r” é incrementado.

Estado **ff**

```
235         -- Estado final de derrota
236         when ff => leds<=try;
237                    nibble<=try;
238
239                    if ( start='1' ) then
240                      pr_state<=print;
241                      key_delay<=T;
242                      lvl<=1;
243                      n<=0;
244                      s<=1;
245                      r<=r+1;
246                      if (r=9) then
247                         r<=0;
248                      end if;
249                    end if;
250
251         end case;
```

O estado *ff* é o estado de derrota do jogo, quando o jogador erra uma cor da sequência ou demora muito tempo para repeti-la. Da mesma forma como em gg, espera-se que *start* vá para ‘1’ para reinicializar o jogo e mudar a sequência a ser exibida nesta próxima rodada.

2.1.4. Decoder.vhd

Parte 1

```
1  library IEEE;
2  use IEEE.STD_LOGIC_1164.ALL;
3  use work.global_pack.all;
4
5  entity Decoder is
6
7     generic ( f: integer := 4000; -- Tempo de multiplexação
8               l: integer := 25000000); -- Clock de rolagem do display
9     port ( clk, reset: in std_logic; -- Clock, Reset
10           display: out std_logic_vector (6 downto 0); -- Segmentos dos displays (catodos)
11           anode: out std_logic_vector (3 downto 0); -- Anodos dos displays
12           pr_state: in states; -- Estado atual da máquina
13           lvl: in integer range 1 to 14); -- Nível atual do jogo
14
15 end Decoder;
```

No início do código do decoder para os displays de sete segmentos, tem-se a declaração das entradas e saídas do component. Cabe destacar os tempos de rolagem do display (0,5s) e o tempo para multiplexação dos anodos (80us).

(continuação...)

Os catodos e os anodos também são declarados, juntamente com as entradas oriundas do código principal, “pr_state” e “lvl” que repassarão o nível e estado atuais do jogo.

Parte 2

```
31  begin
32
33      -- Processo que realização a multiplexação e impressão dos valores nos displays
34      process(clk, lvl, reset, pr_state)
35      begin
36
37          if ( reset='1' ) then
38              i<=3;
39              j<=19;
40              count_l<=1;
41              count_f<=f;
42
43          elsif ( rising_edge(clk) ) then
44              count_f<=count_f-1;
45              count_l<=count_l-1;
46              if (count_f=0) then
47                  count_f<=f;
48                  i<=i-1;
49                  if (i=0) then
50                      i<=3;
51                  end if;
52              end if;
53              if (count_l=0) then
54                  count_l<=1;
55                  j<=j-1;
56                  if (j=0) then
57                      j<=19;
58                  end if;
59              end if;
60          end if;
```

Este *process* contém a lógica para multiplexação e rolamento da mensagem inicial nos displays de sete segmentos. Utilizando dois contadores, a multiplexação é realizada percorrendo as posições do vetor de enables que habilita cada um dos anodos por vez. Já a rolagem é feita somando-se um o signal “j” a variável “i”, o que promove um deslocamento dentro do vetor da mensagem das quatro posições que são exibidas nos displays.

Parte 3

```
62        -- Case que verifica o nível atual e repassa o valor adequado de pontuação para exibição
63        case lvl is
64
65              when 1 => pont <= ("1111111","0000001","0000001","1111111");
66
67              when 2 => pont <= ("1111111","0000001","1001111","1111111");
68
69              when 3 => pont <= ("1111111","0000001","0010010","1111111");
70
71              when 4 => pont <= ("1111111","0000001","0000110","1111111");
72
73              when 5 => pont <= ("1111111","0000001","1001100","1111111");
74
75              when 6 => pont <= ("1111111","0000001","0100100","1111111");
76
77              when 7 => pont <= ("1111111","0000001","0100000","1111111");
78
79              when 8 => pont <= ("1111111","0000001","0001111","1111111");
80
81              when 9 => pont <= ("1111111","0000001","0000000","1111111");
82
83              when 10 => pont <= ("1111111","0000001","0000100","1111111");
84
85              when 11 => pont <= ("1111111","1001111","0000001","1111111");
86
87              when 12 => pont <= ("1111111","1001111","1001111","1111111");
88
89              when 13 => pont <= ("1111111","1001111","0010010","1111111");
90
```

No *case* acima, tem-se a definição do que o signal “pont” irá receber com base no nível atual do jogo correspondente a pontuação, a fim de decodificar os números decimais para exibição nos displays. Este sinal será transmitido aos catodos caso se esteja num estado onde a pontuação deve ser exibida.

Parte 4

```
 95        -- Case que vericia o estado atual da máquina e o que deve ser exibido nos displays
 96        case pr_state is
 97
 98              when idle =>  display <= projeto_aplic(i+j);
 99
100              when ff => display <= gameover(i);
101
102              when gg => display <= win(i);
103
104              when others => display <= pont(i);
105
106        end case;
107
108        -- Atribuição aos anodos do modo atual para multiplexação
109        anode <= anodos(i);
110
111     end process;
112
113
114  end Behavioral;
```

Neste *case*, sensível ao estado presente da máquina, verifica-se o que os displays devem exibir no momento (mensagem inicial, pontuação, mensagem “GG” ou mensagem “FF”).

2.1.5. VGA.vhd

Parte 1

```
1  library ieee;
2  use ieee.std_logic_1164.all;
3  use work.global_pack.all;
4  use work.rom_characters.all;
5
6  entity VGA is
7
8    generic(
9      h_pulse  :  integer   := 120; -- Largura do pulso de sincronização horizontal em pixels
10     h_bp     :  integer   := 64; -- Largura do back porch horizontal em pixels
11     h_pixels :  integer   := 800; -- Largura de display horizontal em pixels
12     h_fp     :  integer   := 56; -- Largura do front porch horizontal em pixels
13     h_pol    :  std_logic := '1'; -- Polaridade da sincronização horizontal (1 = positiva, 0 = negativa)
14     v_pulse  :  integer   := 6; -- Largura do pulso de sincronização vertical em linhas
15     v_bp     :  integer   := 23; -- Largura do back porch vertical em linhas
16     v_pixels :  integer   := 600; -- Largura de display vertical em linhas
17     v_fp     :  integer   := 37; -- Largura do front porch vertical em linhas
18     v_pol    :  std_logic := '1'); --Polaridade da sincronização vertical (1 = positiva, 0 = negativa)
19
20   port(
21     clk       :  in   std_logic; -- Pixel clock
22     reset     :  in   std_logic;  -- Reset
23     nibble    :  in   std_logic_vector (3 downto 0); -- Estado dos leds
24     lvl       :  in   integer range 1 to 14; -- Nível atual do jogo
25     pr_state  :  in   states; -- Estado da máquina
26     h_sync    :  out  std_logic; -- Pulso de sincronização horizontal
27     v_sync    :  out  std_logic; -- Pulso de sincronização vertical
28     red       :  out  std_logic_vector (2 downto 0); -- Bits do vermelho do VGA
29     green     :  out  std_logic_vector (2 downto 0); -- Bits do verde do VGA
30     blue      :  out  std_logic_vector (1 downto 0)); -- Bits do azul do VGA
31
32 end VGA;
```

Tomando como base o controlador VGA em VHDL disponibilizado no site eewiki[3], e também o datasheet do kit de desenvolvimento nexys 2[6], desenvolveu-se um código para exibir as sequências de cores e pontuações do jogo através do VGA.

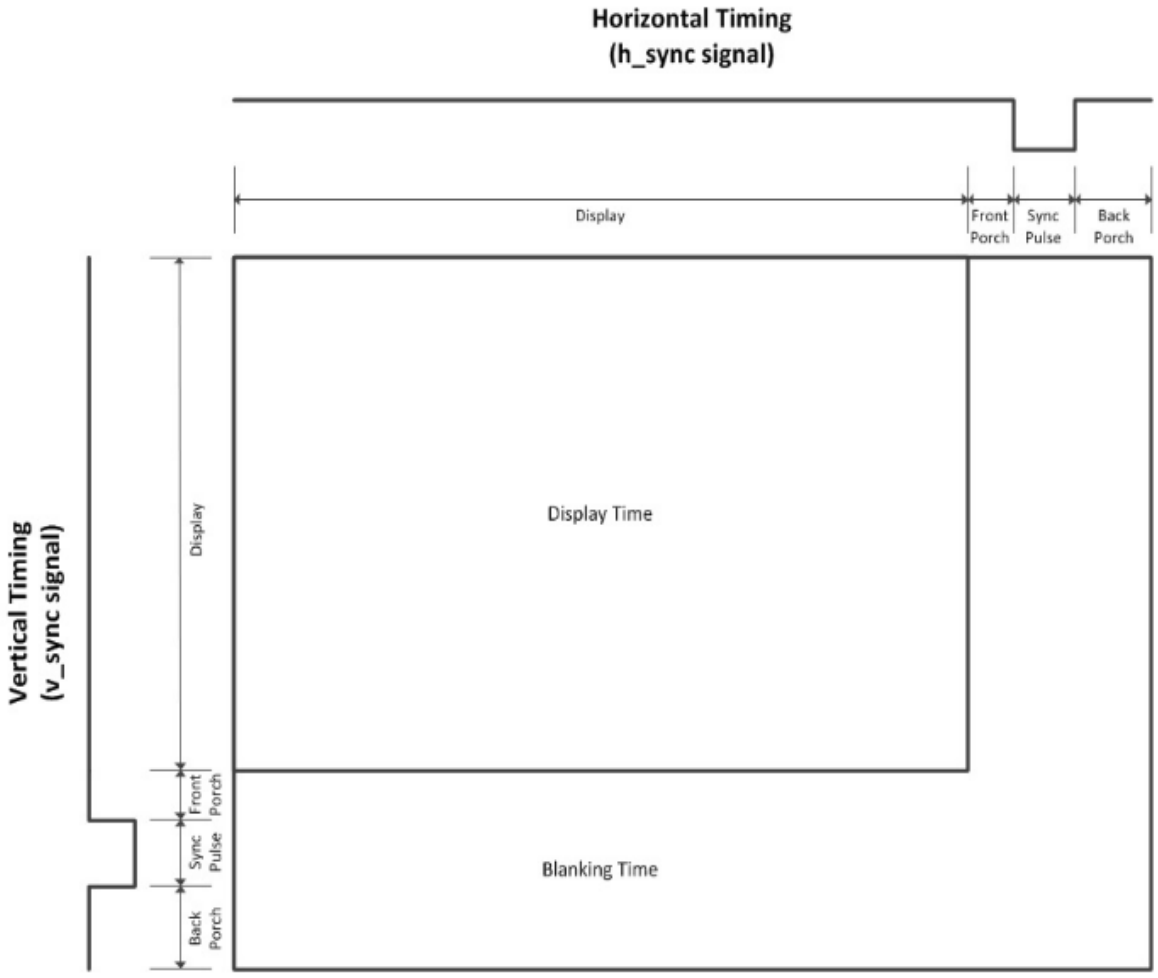
Foi decidido utilizar a resolução 800x600 (72Hz) para implementação do VGA já que tal resolução necessita de um *pixel clock* de 50Mhz, que coincide com o clock disponível no kit de desenvolvimento.

O VGA requer, fora os bits do RGB para definir cor do *pixel*, dois sinais de sincronização que permitem a correta atualização do monitor e varredura das linhas. O VGA funciona percorrendo uma linha completa e então avançando verticalmente para baixo, sendo assim, o sinal de sincronização horizontal ocorre com muito mais frequência que o vertical.

Fora o pulso de sincronização, existem dois intervalos de tempo, denominados de *back porch* e *front porch*, antes e depois do pulso de sincronização, em que nenhum *pixel* é atualizado. Todos esses tempos variam de resolução a resolução, bem como a polaridade do pulso. Sendo assim, os valores desses intervalos de tempo para a resolução escolhida, em função dos *pixels* e linhas, foram devidamente declarados como *generic,* tanto para a horizontal, como vertical.

Além disso, as entradas de clock e reset também foram declaradas, bem como as saídas (RGB e *sync*) e as entradas referente ao estado atual e ao nível do jogo, para permitir a implementação da lógica do que deve ser impresso na tela.

Esquemático de monitor VGA e sinais de sincronização



Este esquema[3] exemplifica melhor o funcionamento do sistema VGA descrito anteriormente, mostrando os tempos de display, *front porch,* pulso de *sync* e *back porch*. Quando estamos no "*Display Time"*, estamos no período de tempo em que os *pixels* recebem os dados RGB para formação da imagem. Em *"Blanking Time"*, nada é enviado para tela pois nos encontramos no tempo de atualização, onde é preciso manter os bits RGB em '0'.

Parte 2

```
34  architecture behavior of VGA is
35
36    constant  h_period  :  integer := h_pulse + h_bp + h_pixels + h_fp;
37    constant  v_period  :  integer := v_pulse + v_bp + v_pixels + v_fp;
38    shared variable h_count  :  integer range 0 to h_period - 1 := 0;
39    shared variable v_count  :  integer range 0 to v_period - 1 := 0;
40    shared variable red_var : std_logic_vector (2 downto 0) := ( others => '0');
41    shared variable green_var : std_logic_vector (2 downto 0) := ( others => '0');
42    shared variable blue_var : std_logic_vector (1 downto 0) := ( others => '0');
43
44  begin
45
46    process(clk, reset, pr_state)
47    begin
48
49      -- Reinicia o VGA em caso de reset
50      if(reset = '1') then
51        h_count := 0;
52        v_count := 0;
53        h_sync <= not h_pol;
54        v_sync <= not v_pol;
55
56      elsif(rising_edge(clk)) then
57
58        -- Contadores
59        if(h_count < h_period - 1) then
60          h_count := h_count + 1;
61        else
62          h_count := 0;
63          if(v_count < v_period - 1) then
64            v_count := v_count + 1;
65          else
66            v_count := 0;
67          end if;
68        end if;
69
70        -- Sincronização Horizontal
71        if(h_count < h_pixels + h_fp or h_count > h_pixels + h_fp + h_pulse) then
72          h_sync <= not h_pol;
73        else
74          h_sync <= h_pol;
75        end if;
76
77        -- Sincronização Vertical
78        if(v_count < v_pixels + v_fp or v_count > v_pixels + v_fp + v_pulse) then
79          v_sync <= not v_pol;
80        else
81          v_sync <= v_pol;
82        end if;
```

O *process* do VGA verifica a presença do *reset* e, em caso afirmativo, mantém a tela apagada, sem envio de nenhum sinal. Caso contrário, a contagem horizontal é atualizada a cada subida do clock e a contagem vertical a cada vez que se chega no fim da linha. Utilizando esses contadores, é possível determinar em que posição da área de display o sistema encontra-se e definir qual deve ser o valor do pulsos de sincronização e dos bits RGB.

Parte 3

```
84        -- Verifica se está dentro da área de impressao do display e implementa a lógica para cada estado
85        if(h_count < h_pixels and v_count < v_pixels) then
86
87           if (v_count>300) then
88              if (nibble="1000") then
89                 if (h_count<200) then
90                    red <= "111";
91                    green <= "000";
92                    blue <= "00";
93                 else
94                    red <= (others => '0');
95                    green <= (others => '0');
96                    blue <= (others => '0');
97                 end if;
98              elsif (nibble="0100") then
99                 if (h_count>200 and h_count<400) then
100                   red <= "000";
101                   green <= "000";
102                   blue <= "11";
103                else
104                   red <= (others => '0');
105                   green <= (others => '0');
106                   blue <= (others => '0');
107                end if;
```

Este trecho exemplifica como foi implementada a lógica para saber o que deve ser impresso na tela de acordo com a posição que estamos e a cor atual da sequência. Para isso, o *signal* “nibble” é utilizado, repassando o estado dos LEDs e por consequência qual cor deve ser impressa. Cada uma das cores possui uma região retangular 200x300 na parte inferior da tela.

2.2. ANÁLISE DOS RESULTADOS

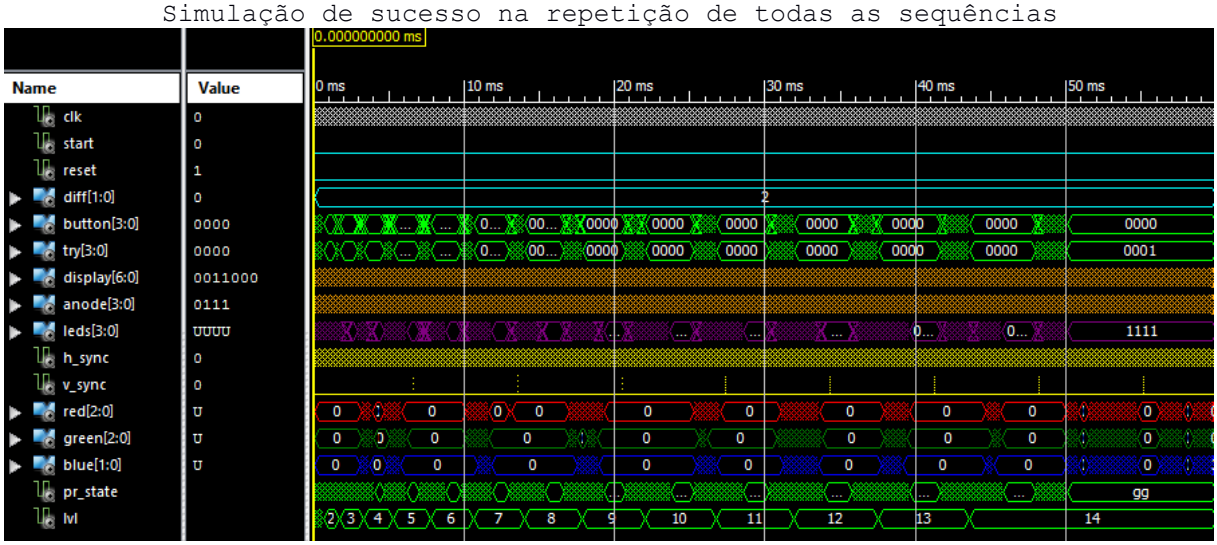
2.2.1. Testbench.vhd

```
114         reset<='1';
115         button<="0000";
116         diff<="00";
117         start<='0';
118         wait for 100 ns;
119         reset<='0';
120         diff<="10";
121         start<='1';
122         wait for 100 ns;
123         start<='0';
124         wait for 600 us;
125         button<="1000";
126         wait for 50 us;
127         button<="0000";
128         wait for 900 us;
129         button<="1000";
130         wait for 50 us;
131         button<="0000";
132         wait for 100 us;
133         button<="0100";
134         wait for 50 us;
135         button<="0000";
136         wait for 1200 us;
137         button<="1000";
138         wait for 50 us;
139         button<="0000";
140         wait for 100 us;
141         button<="0100";
```

O *testbench* do projeto completo foi implementado de modo a simular o pressionamento dos botões e das chaves de start e dificiculdade, verificando o comportamento do sistema de acordo com as mudanças de entrada.

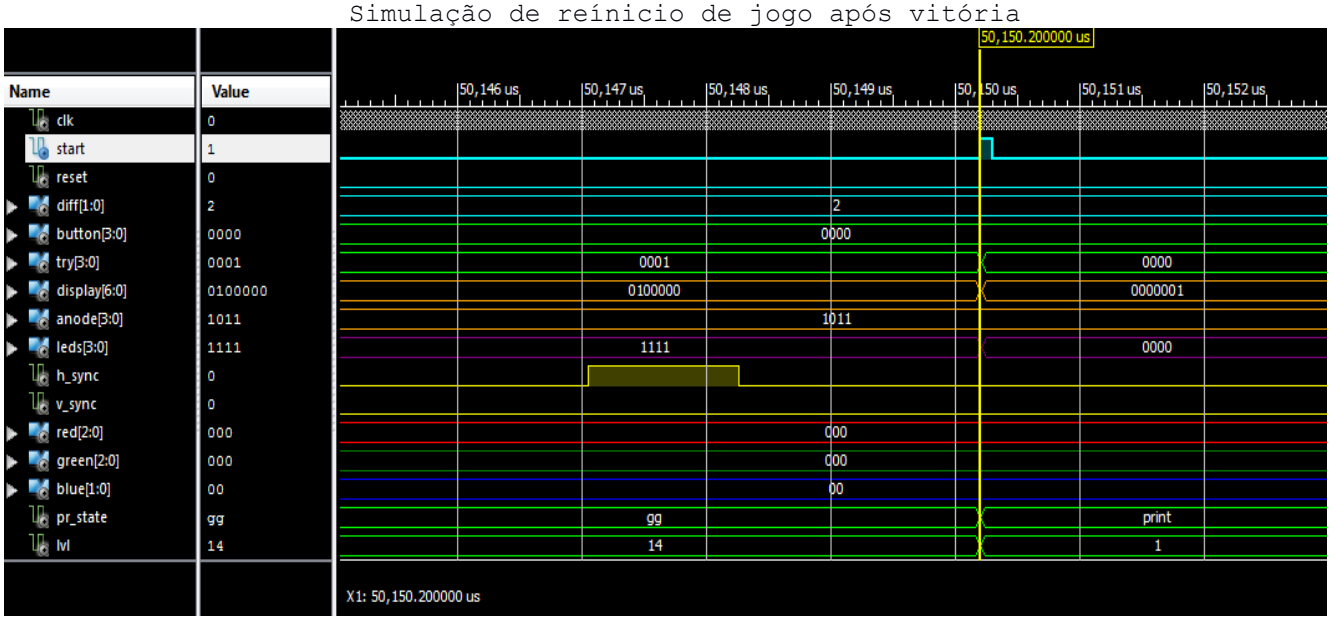
2.2.2. Simulações

Simulação de sucesso na repetição de todas as sequências



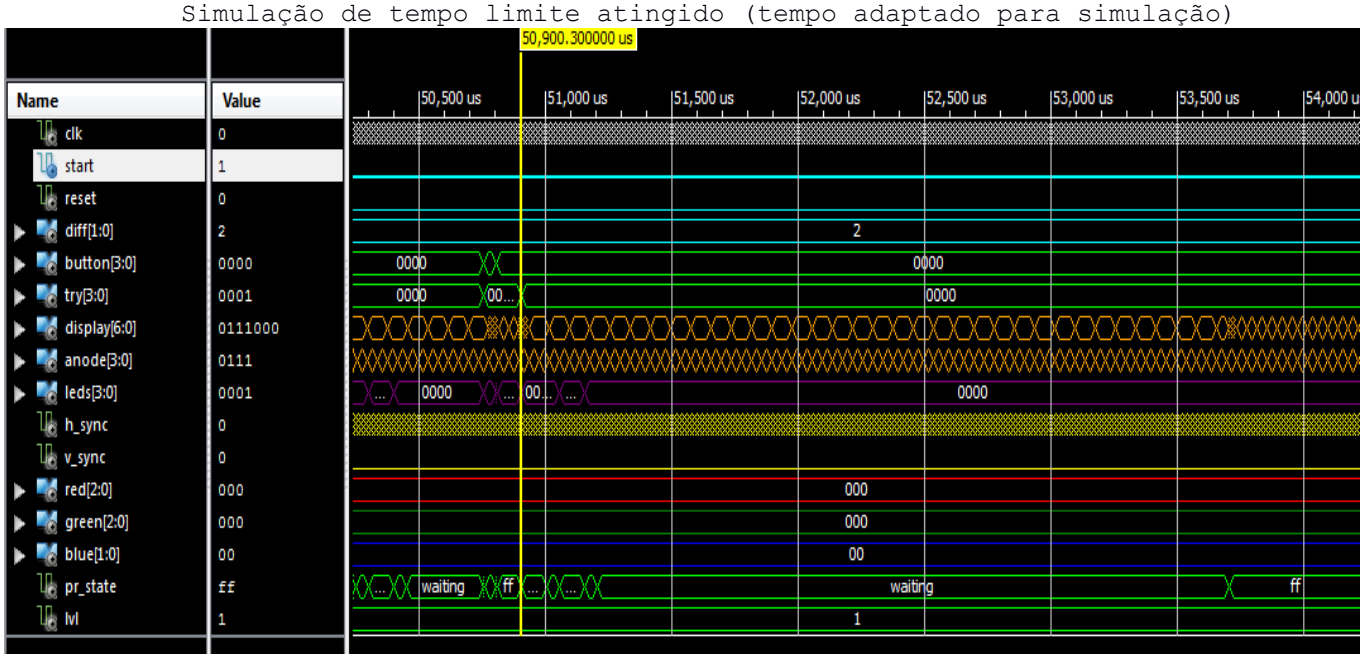
Esta primeira simulação verifica se o jogo evolui de maneira adequada ao receber corretamente as repetições das sequências de cores. Podemos verificar no último sinal (*lvl)* que o jogo avançou até o nível de dificuldade 14 e após se repetir a última sequência corretamente o jogo avançou e permaneceu no estado de vitória “gg”. É possível notar também que o tempo para avançar de nível aumenta progressivamente, já que mais tempo é despendido imprimindo a sequência de cores e mais tempo faz-se necessário para que o jogador repita a sequência utilizando os *push-buttons*. Um detalhe é a velocidade da ocorrência da sincronização horizontal do VGA em relação a vertical, conforme esperado.

Simulação de reínicio de jogo após vitória



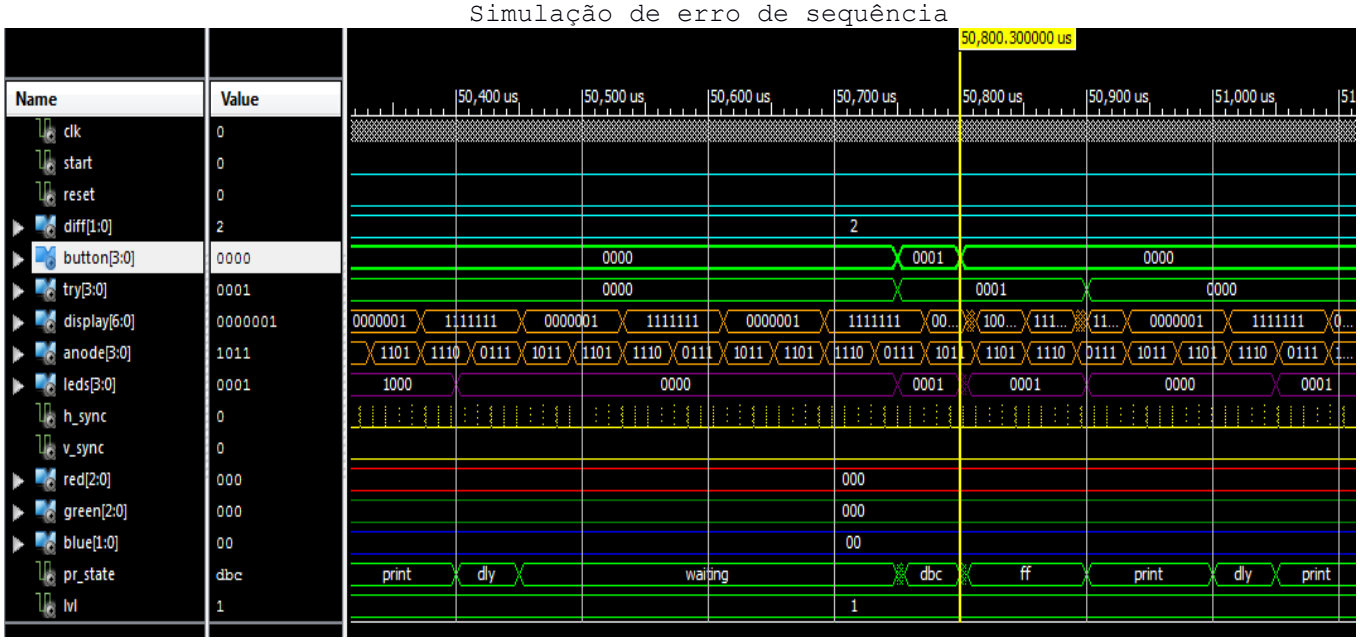
Nesta simulação verificou-se o reinício adequado do jogo após a vitória, onde a chave *start* tem seu estado alterado e então o jogo vai para o estado *print* conforme esperado. Pode-se ver também que o display zera a pontuação e notamos o pulso se sincronização horizontal ocorrendo. Além disso, vemos que os LEDs vão para “0000”, pois no ínicio de todas as sequências existe uma etapa a mais em que os LEDs permancem apagados, gerando um tempo para o jogador preparar-se para jogar equivalente ao de impressão de uma cor para o nível selecionado.

Simulação de tempo limite atingido (tempo adaptado para simulação)



Nesta simulação, verificou-se que após imprimir uma cor e aguardar o jogador por um tempo maior que o limite, o jogo automaticamente vai para o estado de derrota, pois nenhum botão foi pressionado dentro do intervalo especificado.

Simulação de erro de sequência



Nesta última etapa de testes, vericou-se que após um erro na repetição da sequência o jogo vai para o estado de derrota “ff”. No começo da simulação a esquerda, a sequência “1000” é mostrada pelos LEDs e após algum tempo o jogador pressiona o botão errado, enviando a tentativa como “0001”, que também é impressa, o que permite ao jogador visualizar que cor inseriu. Após o *debouncing* do botão, verificou-se o erro e mudou-se para o estado “ff”.

2.2.3 Análise de utilização de recursos

Genius Project Status (11/29/2016 - 00:44:08)			
Project File:	Genius.xise	**Parser Errors:**	No Errors
Module Name:	Genius	**Implementation State:**	Programming File Generated
Target Device:	xc3s500e-5fg320	**• Errors:**	No Errors
Product Version:	ISE 14.7	**• Warnings:**	No Warnings
Design Goal:	Timing Performance	**• Routing Results:**	All Signals Completely Routed
Design Strategy:	Performance without IOB Packing	**• Timing Constraints:**	All Constraints Met
Environment:	System Settings	**• Final Timing Score:**	0 (Timing Report)

Device Utilization Summary [-]				
Logic Utilization	**Used**	**Available**	**Utilization**	**Note(s)**
Number of Slice Flip Flops	1,355	9,312	14%	
Number of 4 input LUTs	5,254	9,312	56%	
Number of occupied Slices	2,743	4,656	58%	
Number of Slices containing only related logic	2,743	2,743	100%

Total Number of 4 input LUTs	5,280	9,312	56%	
Number used as logic	5,254			
Number used as a route-thru	26			
Number of bonded IOBs	34	232	14%	
Number of BUFGMUXs	1	24	4%	
Average Fanout of Non-Clock Nets	3.67			

Performance Summary [-]			
Final Timing Score:	0 (Setup: 0, Hold: 0)	**Pinout Data:**	Pinout Report
Routing Results:	All Signals Completely Routed	**Clock Data:**	Clock Report
Timing Constraints:	All Constraints Met		

Após compilado e implementado o *design* do projeto, o relatório de consumo acima foi gerado permitindo a análise da alocação de recursos. Em comparação com os outros projetos já realizados, o projeto aplicativo do jogo Genius teve um consumo muito maior. Tal consumo de recursos deu-se, sobretudo, graças a exigência para implementação da impressão de caracteres 200x200 *pixels* no VGA, e também pelo tamanho e quantidade dos contadores (e consequentemente comparadores) para gerar as bases de tempo necessárias ao jogo. Ao se retirar o trecho de pontuação do VGA e diminuir as constantes de tempo, o consumo de recursos da VGA caiu para em torno de 3 vezes do que o consumo aqui apresentado.

CONCLUSÕES

Com este trabalho pudemos comprovar o funcionamento prático do código de descrição de hardware transferindo o arquivo.bit para a FPGA Nexys 2 Spartan 3.

Pudemos praticar e aprimorar os conhecimentos de linguagem VHDL, de utilização dos softwares Xilinx ISE e Digilent Adept 2 e também verificar a robustez do software ao gerar automaticamente arquivos de simulação e permitir que pudéssemos analisar os resultados gerados através do gráfico da simulação, antes mesmo de sua implementação prática.

O conceito de máquina de estados, demonstrou-se importantíssimo para o desenvolvimento de soluções onde temos diferentes estados possíveis para o sistema, e variáveis de entrada que coordenam a alteração dos mesmos. Através do diagrama de estados, foi possível obter uma noção geral do projeto e definir todas as possíveis transações, permitindo então realizar a implementação do projeto em VHDL.

As funções de bibliotecas do sistema, *package, component* e *procedure* também foram extremamente úteis do ponto de vista de permitir distribuir-se melhor os componentes do jogo e criar trechos de lógica e tipos reutilizáveis em todos os outros códigos do projeto.

Não menos importante, o kit de desenvolvimento mostrou toda a capacidade que possui ao suportar a implementação de tal projeto, que demandou uma quantidade razoável de recursos da FPGA.

Por fim, ao término deste projeto aplicativo, comprova-se o quão rica de possibilidades e útil é a linguagem VHDL, permitindo que engenheiros e demais entusiastas possam descrever *hardwares* para operar nas mais diversas funcões e finalidades, sendo este um dos pilares da área de sistemas embarcados.
